STREAMLINING IT PROCUREMENT

Automating Standard Laptop Orders with Flow Designer

8-Phase Project Report

Brainstorming & Ideation • Requirement Analysis • Project Design • Project Planning • Project Development • Project Testing • Project Documentation • Project Demonstration

Prepared using the supplied ServiceNow project template

1. Brainstorming & Ideation Phase

The project idea is to make standard laptop ordering easier by using ServiceNow Flow Designer. In the existing process, laptop requests can involve manual follow-up and delays before the hardware team configures the laptop.

Key Activities

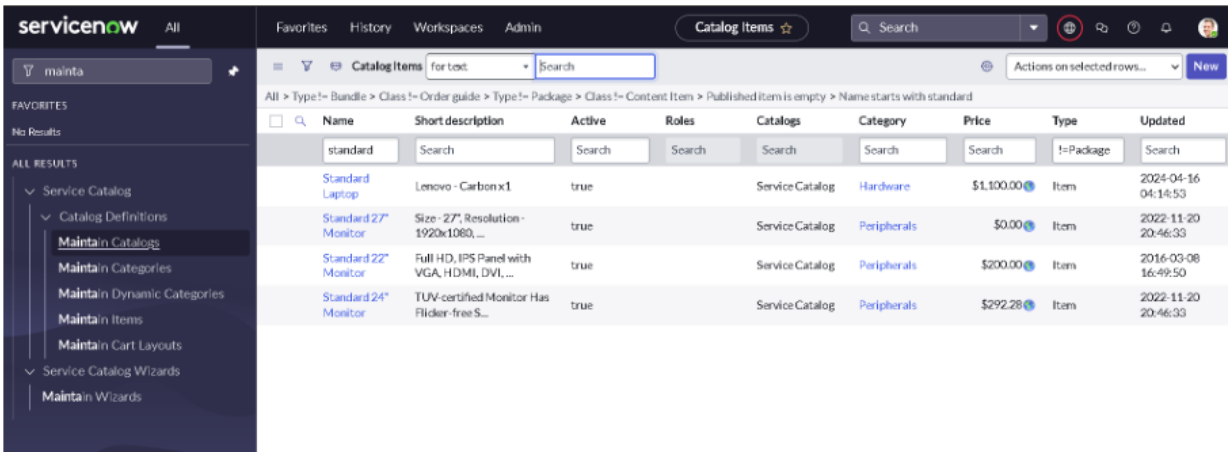

• Identify the main problem: manual work and delays in standard laptop orders.

• Decide on an automated workflow that starts from a Service Catalog request.

• Plan to create a Catalog Task automatically and assign it to the Hardware group.

• Expected benefit: less manual intervention and faster laptop configuration.

2. Requirement Analysis Phase

The requirements are based on the standard laptop request process described in the template. The flow should act on the service request and create a configuration task for the hardware team.

Key Activities

• The service item is named “Standard Laptop”.

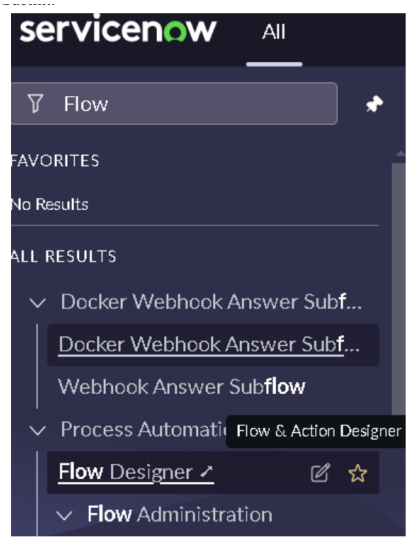

• The flow is named “Standard Laptop Task”.

• The flow uses a Service Catalog trigger.

• A Catalog Task should be created with a clear short description.

• The assignment group should be Hardware and the approval value should be Approved.

3. Project Design Phase

The workflow design connects a Service Catalog trigger to a Create Catalog Task action. After the request is approved, the flow creates a task and fills in the details needed by the hardware team.

Key Activities

• Trigger: Service Catalog.

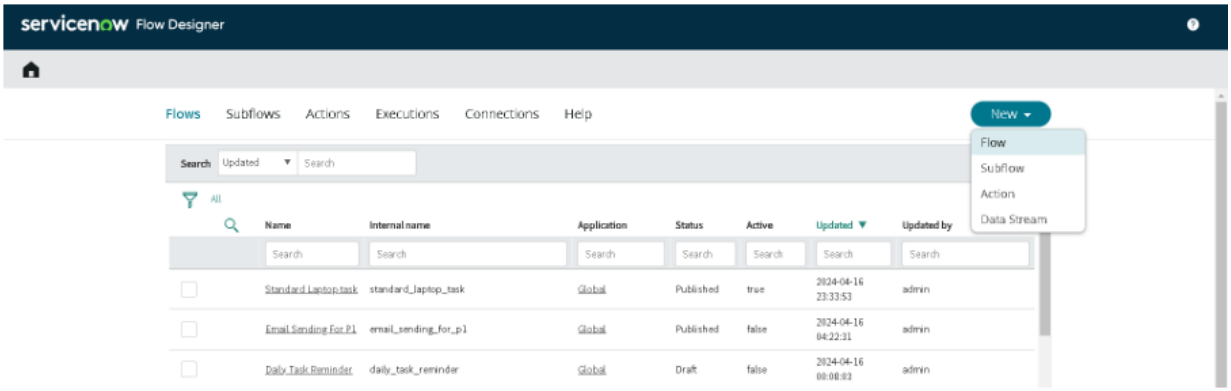

• Action: Create Catalog Task.

• Request item: use the Requested Item record from the trigger.

• Task details: “Laptop need to Configured”.

• Assignment group: Hardware; approval: Approved.

4. Project Planning Phase

The work is organized into three main milestones: create the flow, assign the flow to the Standard Laptop catalog item, and place a test request through the Service Catalog.

Key Activities

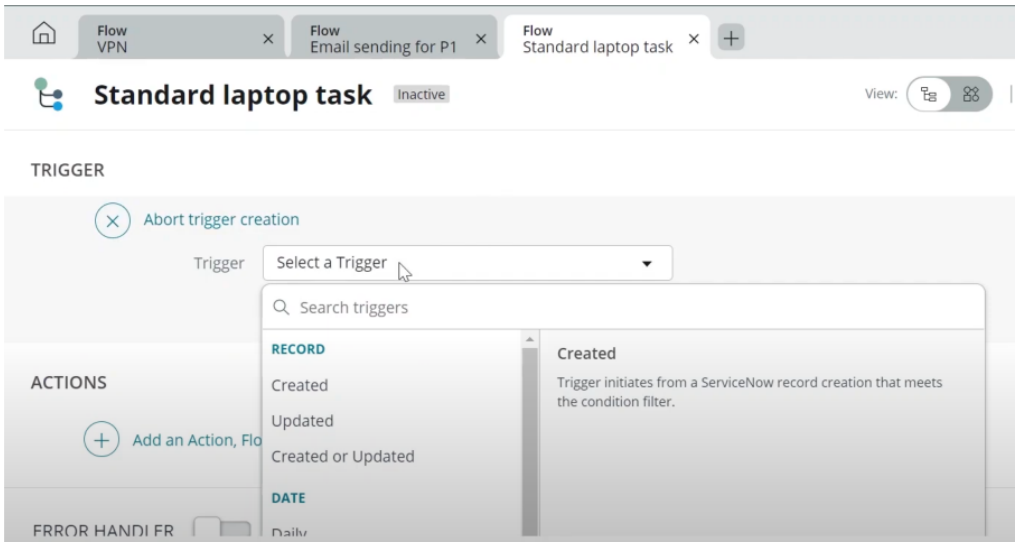

• Milestone 1: create, configure, save, and activate the flow.

• Milestone 2: open Maintain Items and attach the flow to Standard Laptop.

• Milestone 3: submit a Standard Laptop request and check the generated task.

• Keep the flow name and catalog item name consistent throughout the process.

5. Project Development Phase

In this phase, the flow is built in ServiceNow. The flow properties are set first, then the trigger and action are added, and the task fields are configured before saving and activating the flow.

Key Activities

• Open All and search for Flow Designer.

• Create a new Flow named “Standard Laptop Task”. Set Application to Global and Run as to System user.

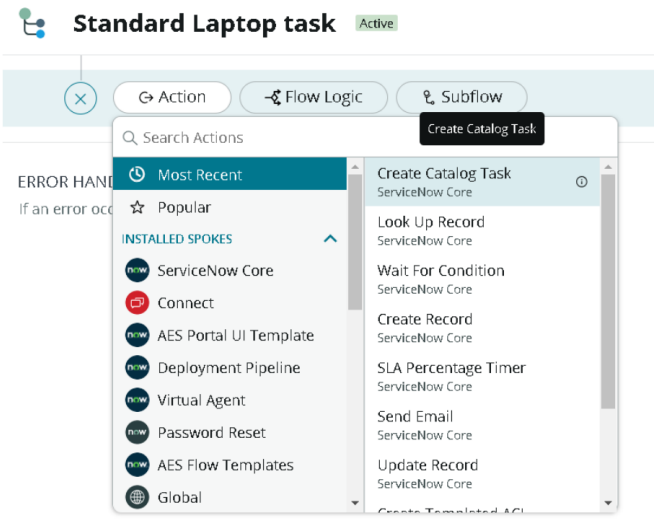

• Add a Service Catalog trigger.

• Add the Create Catalog Task action and map the Requested Item record.

• Set the short description and description to “Laptop need to Configured”, set Assignment group to Hardware, and Approval to Approved.

• Save and activate the flow.

6. Project Testing Phase

Testing checks whether a standard laptop request can move through approval and whether the workflow creates the expected task. The template shows placing an order, opening its request record, and approving it.

Key Activities

• Open Service Catalog and choose Hardware > Standard Laptop.

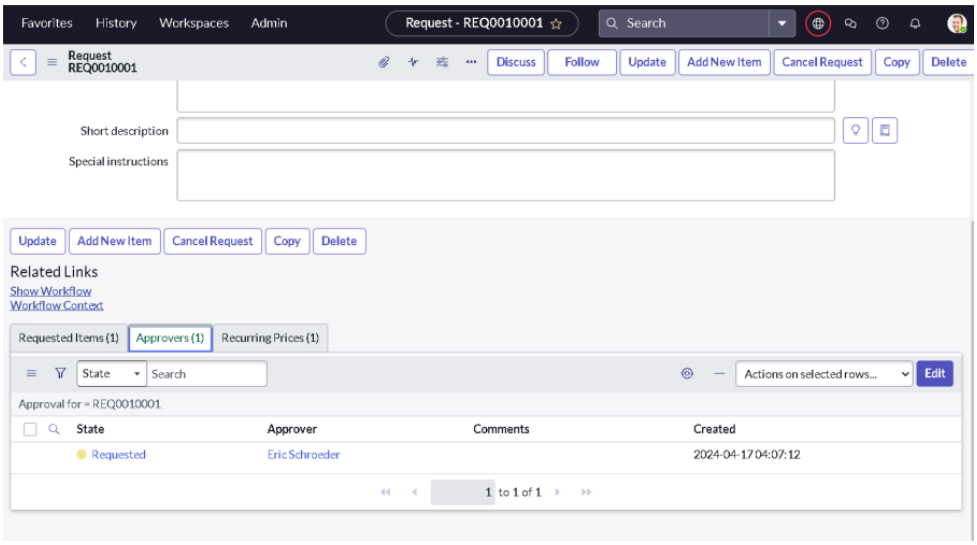

• Select Order Now to submit a test request.

• Open the request number and go to the Approvers section.

• Approve the request, then open its Requested Item record.

• Check whether the Catalog Task is created with the expected details.

7. Project Documentation Phase

The project documentation records the flow configuration and the steps needed to use and verify it. These details make the process easier to repeat and maintain.

Key Activities

• Record the flow name, trigger, action, and field values.

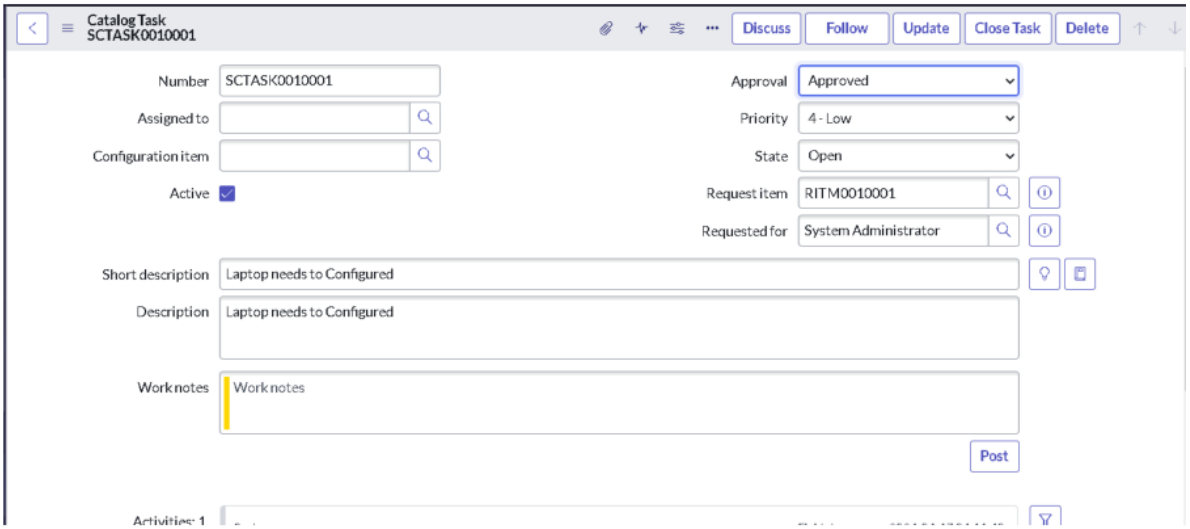

• Document how the flow is attached to the Standard Laptop service catalog item.

• Include the request submission and approval steps.

• Record the expected task short description and Hardware assignment group.

• Use the screenshots at the end of each phase as visual evidence of the process.

8. Project Demonstration Phase

The demonstration shows the complete process from ordering a standard laptop to checking the generated task. The key result is that the approved request produces a Catalog Task with the expected description and assignment group.

Key Activities

• Open the Standard Laptop item in Service Catalog and place an order.

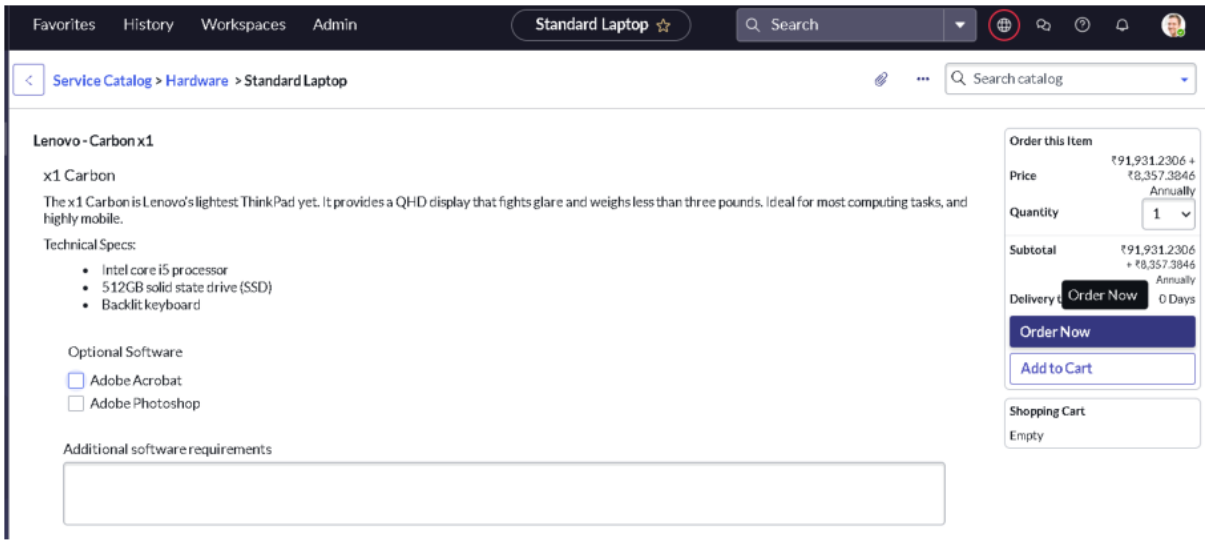

• Show the request number and approve the request.

• Open the Requested Item and then the Catalog Tasks section.

• Open the generated task and verify the short description and Hardware assignment group.

• Explain that the automated workflow reduces manual effort and supports faster laptop configuration.
